Hitachi's Concept Car

From Promotion Video at Tokyo Motor Show, 2003

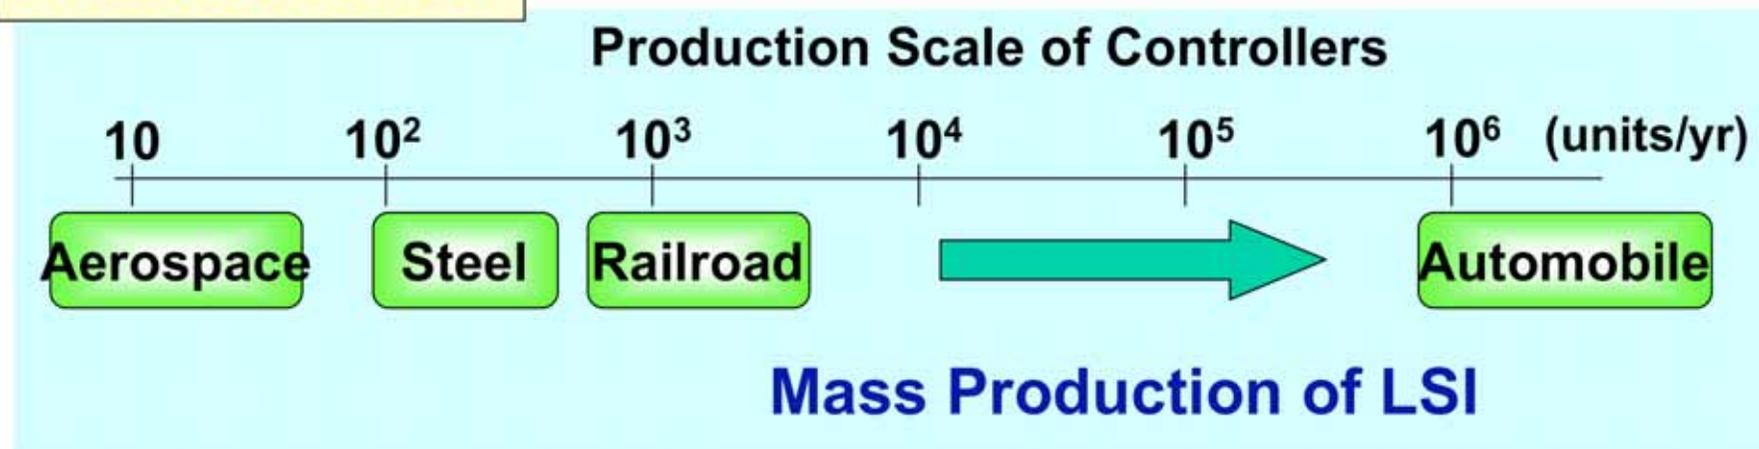

**“Aero-space is no longer high-tech. :
Reliability can be improved with cost.
X-By-Wire is the high-tech., which realizes
dependability with low-cost.”**

– Prof. M. Broy, Technical University of Munich (FTCS-28)

1. What's X-by-Wire ?

2. Our Approach

Cost Reduction

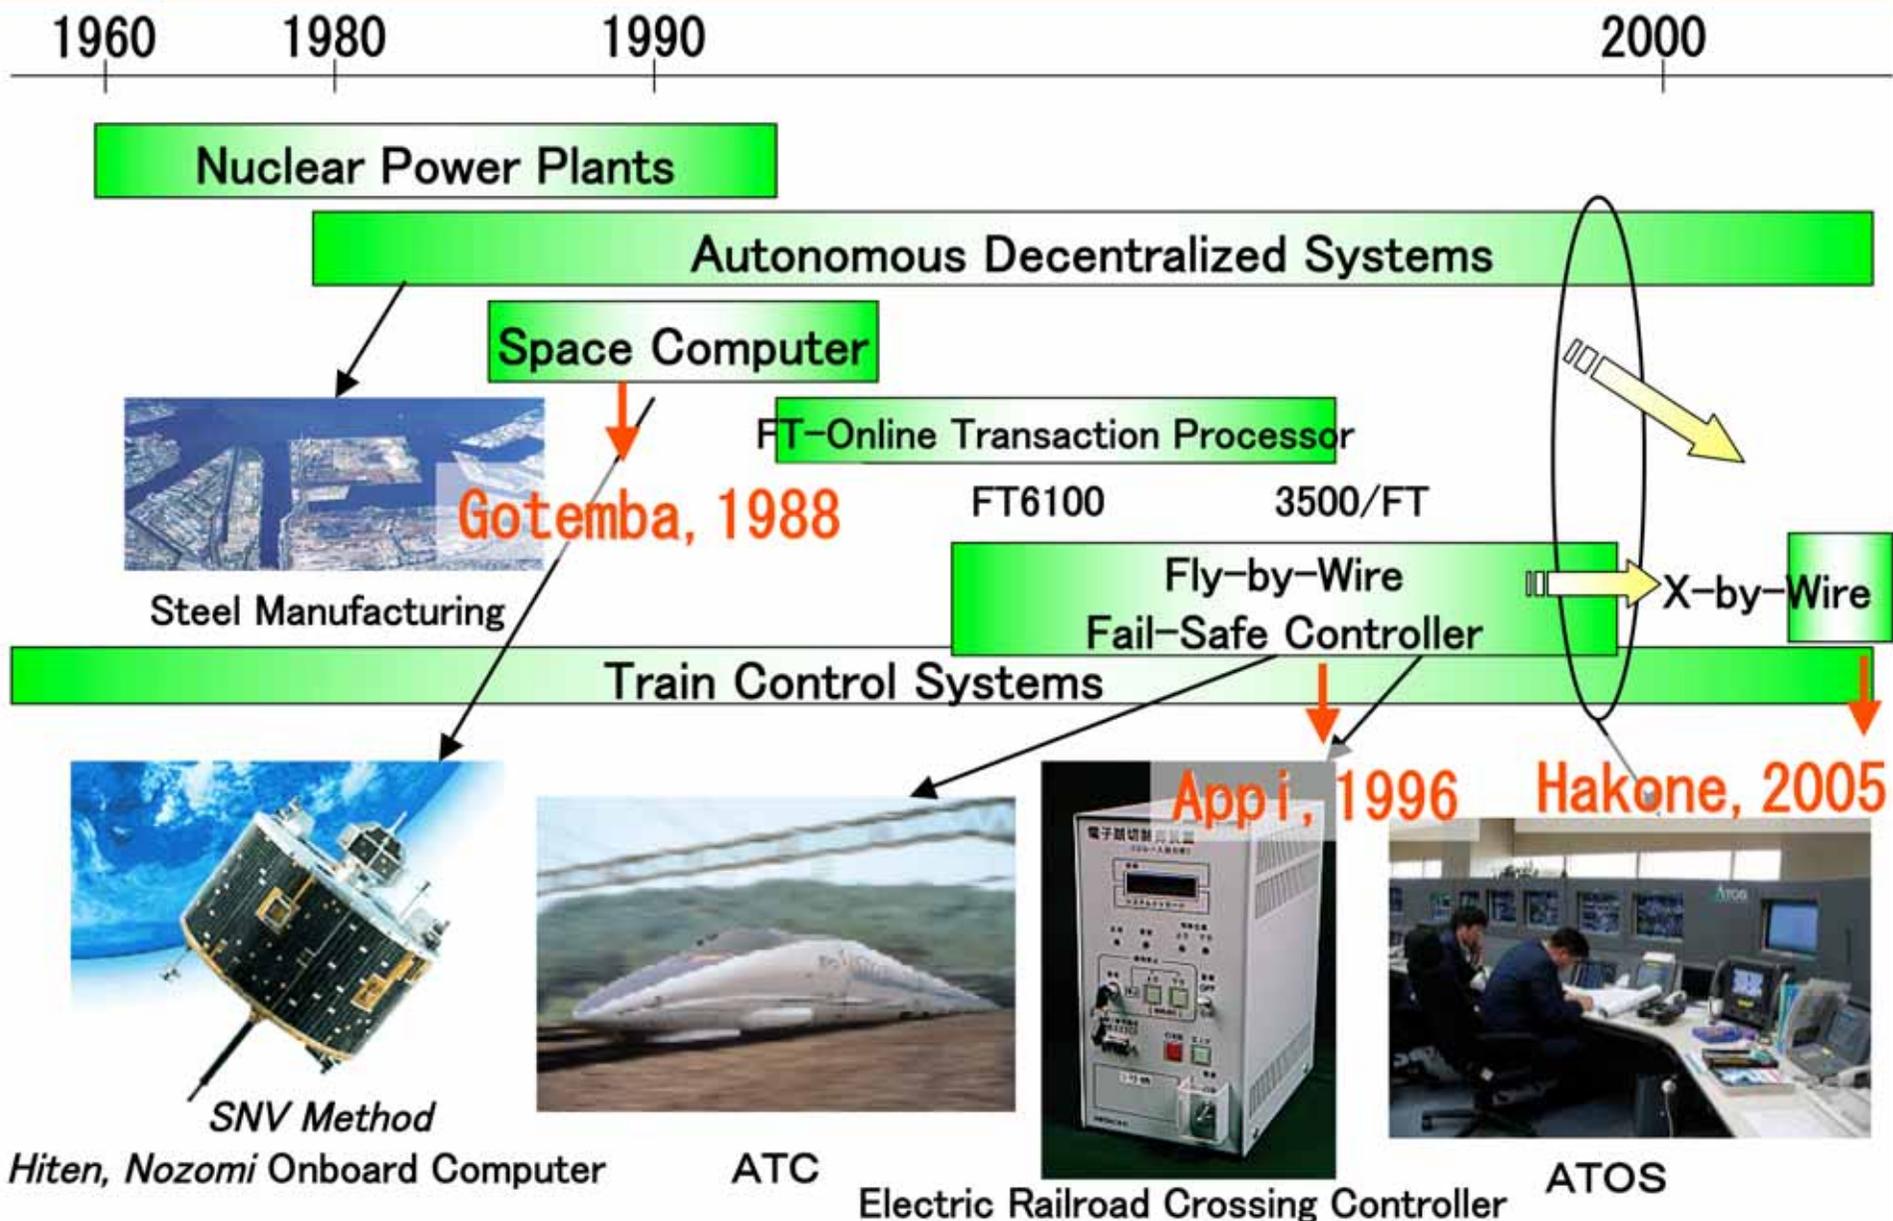

Low-Cost Dependability with LSI Technology

- ✓ Redundant CPUs in One Chip
- ✓ Self-Checking / Failsafe Technology
- ✓ Optimal Clock Diversity

and Autonomous Decentralized Concept

Our Expertise in Dependability

Making Controllers Dependable : Dual CPUs

Dual CPU Controller

Compares outputs of two CPUs.

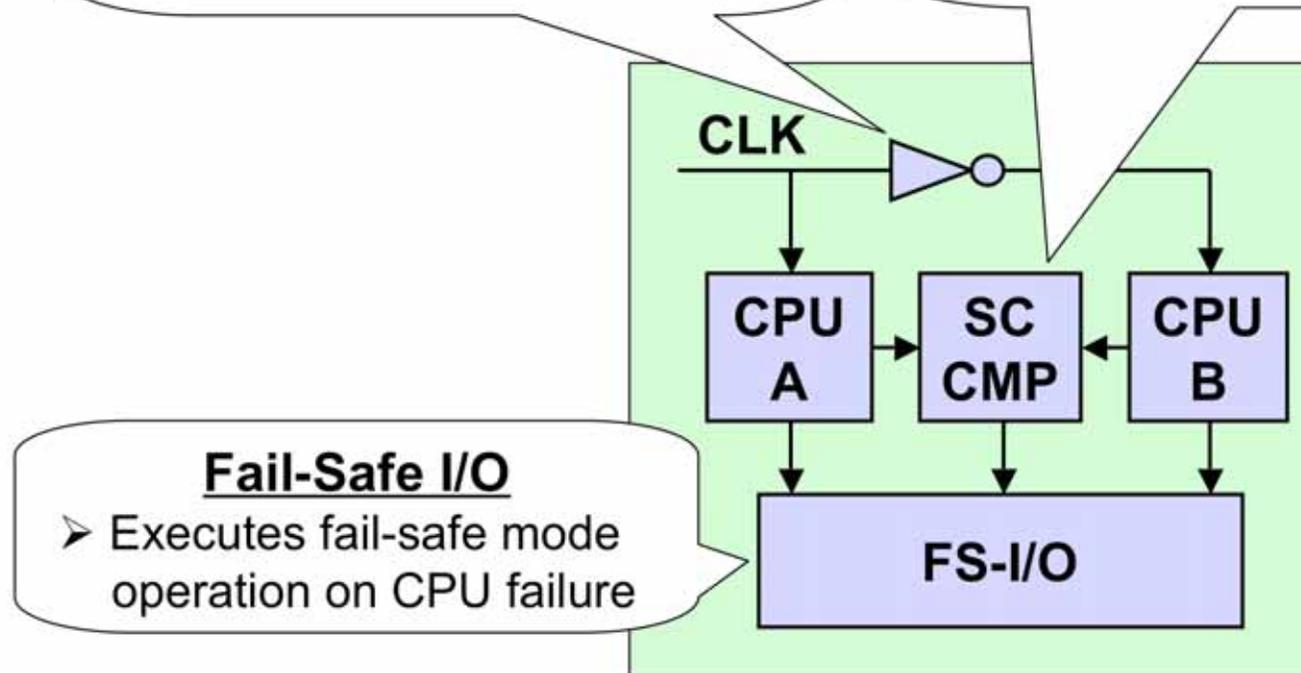

Takes fail-safe mode operation, if there is a difference.

Optimal Clock Diversity

- Operates CPUs out-of-phase
- Improves noise immunity

Self-Checking Comparator

- Self-checks its own operation
- Compares output of two CPUs

Fail-Safe I/O

- Executes fail-safe mode operation on CPU failure

Applications

- Digital ATC
- Crossing Controller

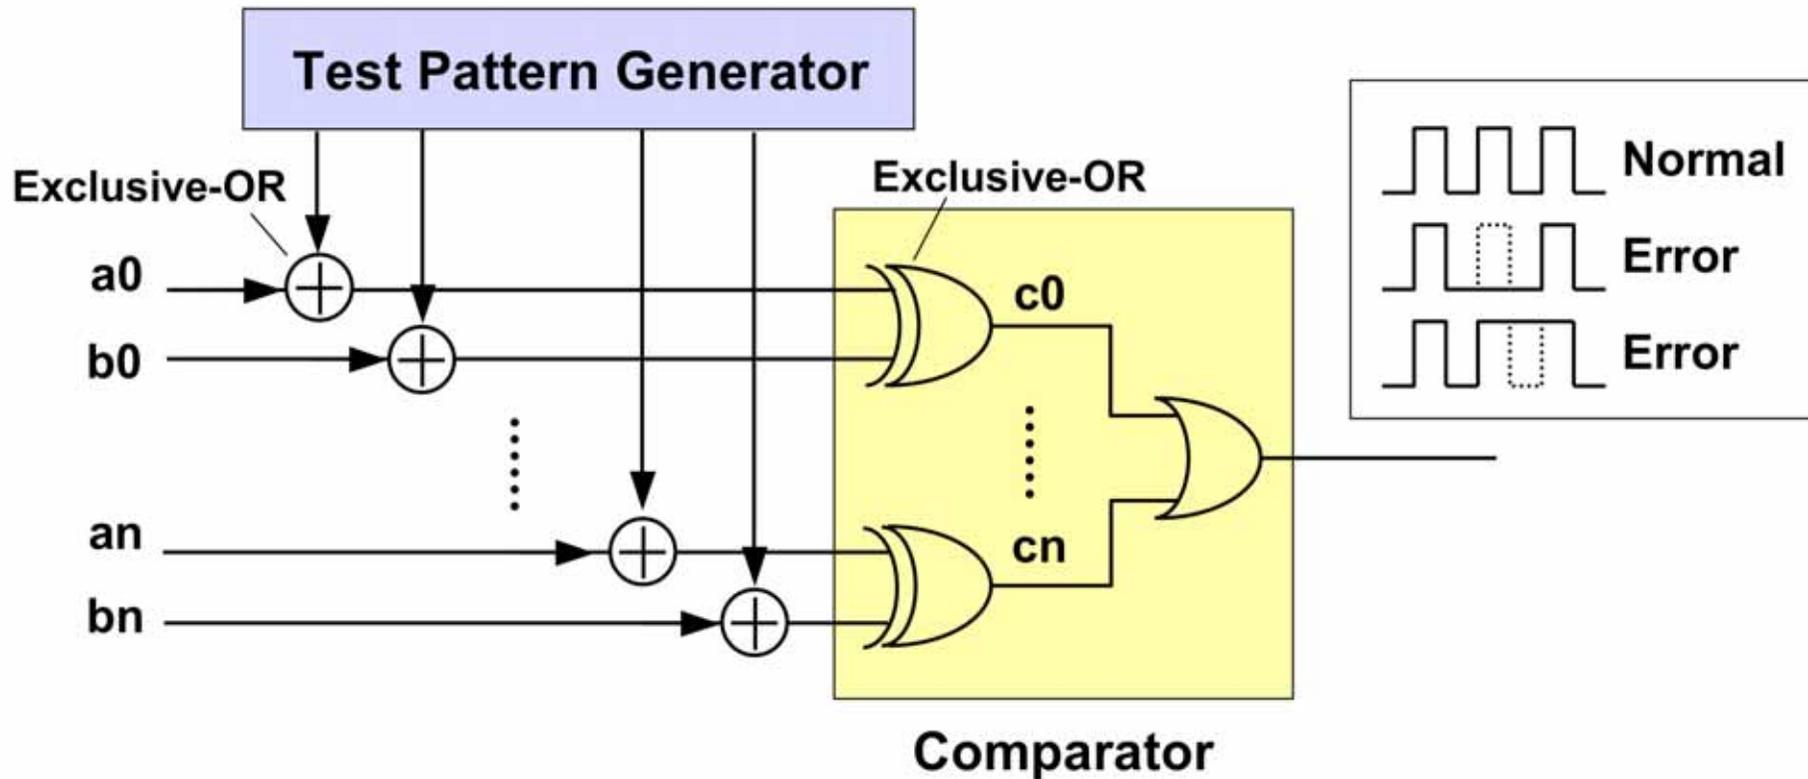

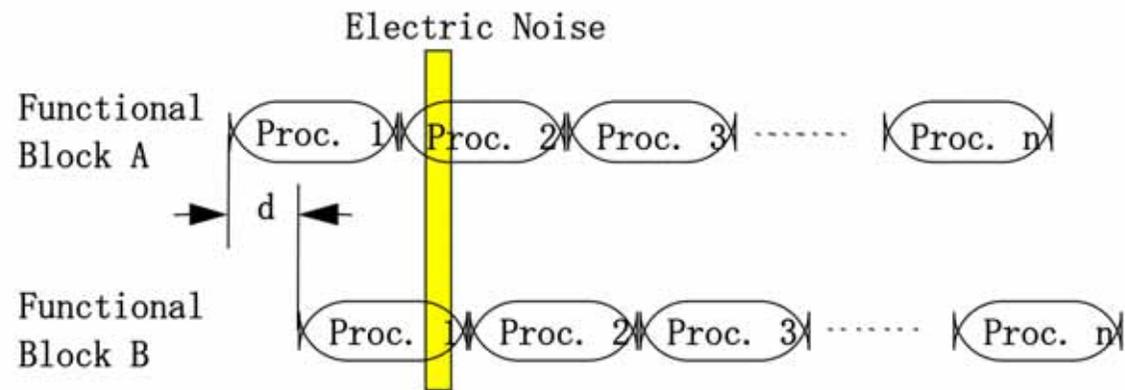

Self-Checking Comparator

Comparison of two outputs

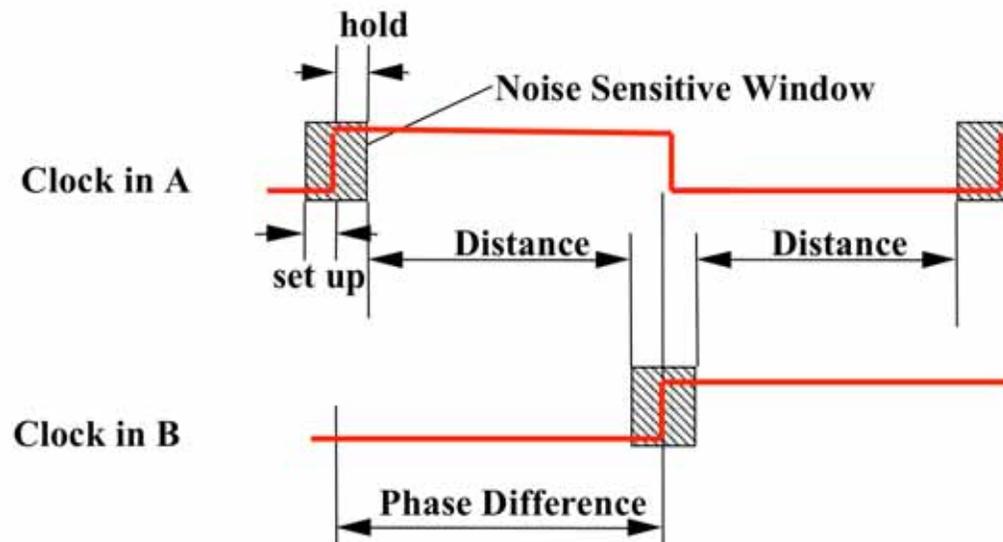

CPU A	a0	a1	a2					an
CPU B	b0	b1	b2					bn

Test Pattern Generator
inputs cyclic error signals

Experimental Results

Intra-Chip Redundancy CPU (FUJINE)

Process	0.35 μm 5 Metal CMOS
Hard Macros	PLL x 2, RAM(40KB)
Random Logic	740k gates
Chip Size	14.75 mm ²
Operating Frequency	60 MHz
Power Dissipation	2.6W @ 60MHz
Package	479pin BGA

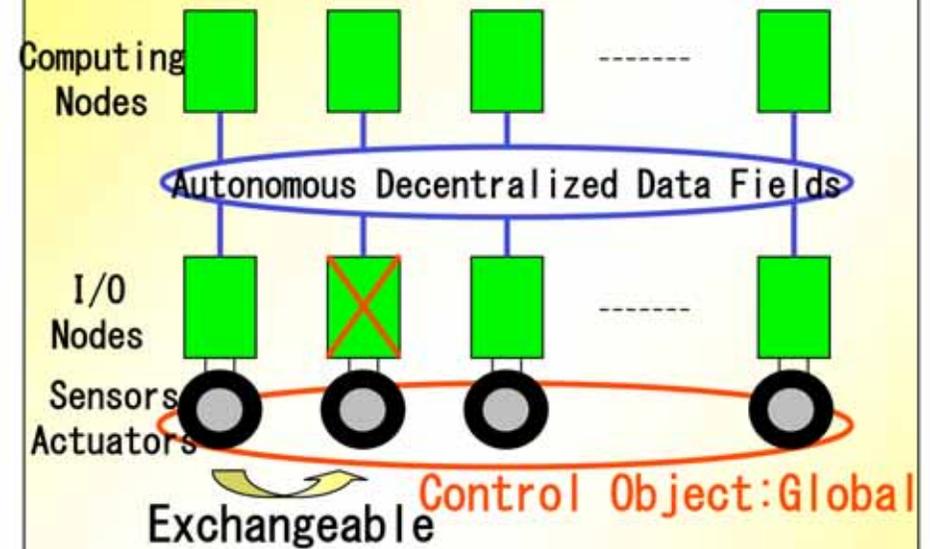

For Most of Applications

Merits:

- ✓ Online System-Expansion
- ✓ Computing Node Dependability (I/O nodes should be redundant)

For Automotive/Aerospace

Merits:

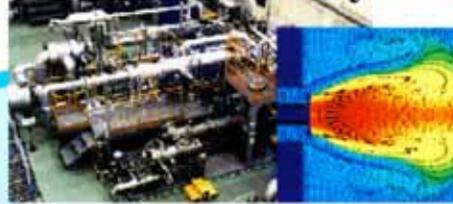

- ✓ Online System-Expansion
- ✓ Computing Node Dependability
- ✓ I/O Node Dependability w/o Redundancy
