Transforming Healthcare Through Medical System Integration: *from architecture to apps*

Julian M. Goldman, MD
Medical Director, Partners HealthCare Biomedical Engineering
Anesthesiologist, Mass Gen Hospital
Director, Medical Device Interoperability Program, CIMIT

www.jgoldman.info

We have come a long way ...

The image shows a standard anesthesia record form with several sections. At the top, there are fields for patient name, date, and time. Below this is a section for pre-operative assessment, including a physical exam and a list of medications. The middle section is a large grid for recording vital signs (heart rate, blood pressure, oxygen saturation, etc.) over time. The bottom section contains a summary of the anesthesia procedure, including the type of anesthesia used and the duration. The form is filled with handwritten notes and signatures.

ANESTHESIA RECORD

We should collect, document, and process these events automatically to decrease errors and improve efficiency

Need:

- Real-time Allergy/drug checking
- Transfusion support
- Fluid balance management
- ACLS protocol adherence

Devices, processes, non-integrated system → errors

The Problem

- There are intractable barriers to improving the safety and efficiency of delivering clinical care
- Many reports confirming that there is significant “room for improvement”

Medication Errors in ICU

Source: Review of 1168 articles --- Medication errors in critical care: risk factors, prevention and disclosure;
Eric Camiré MD, Eric Moyen MD, Henry Thomas Stelfox MD PhD Apr. 28, 2009, issue of *CMAJ*

- 1.7 error per patient per day in ICU
- 29% of these errors if uncorrected, had the potential to cause significant morbidity or even death.
- 70% of patients experience potentially life-threatening error during their stay
- Providing 1 critically ill patient with a single dose of a single medication requires correctly executing 80–200 steps.

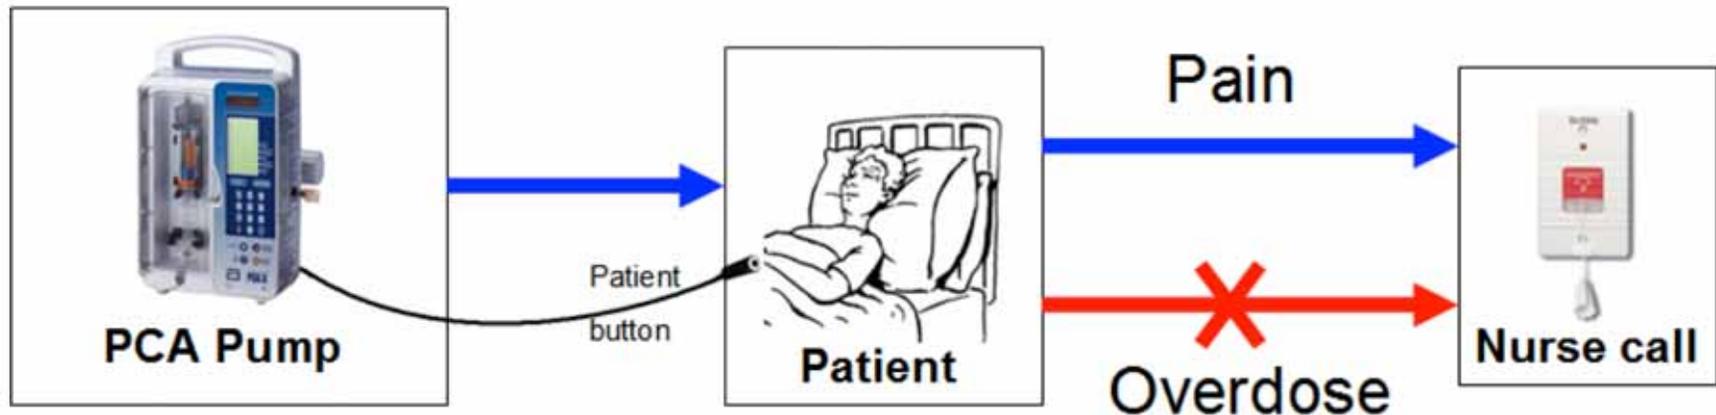

Clinical Scenarios

- Clinical Scenarios help convey the clinical needs and gaps at a high level.
- We will look at several examples ->

Example 1

Patient Controlled Analgesia

Typical Patient Controlled Analgesia System

Patient can call to request more analgesia, but, cannot call for help when over-medicated.

Why not monitor every patient? False and nuisance alarms -> alarm fatigue

Solution: Smarter alarms with sensor fusion + capability to stop medication infusion prior to injury

Winter 2006-2007

Dangers of Postoperative Opioids

APSF Workshop and White Paper Address Prevention of Postoperative Respiratory Complications

- “A particularly attractive feature may be the ability to automatically terminate or reduce PCA (or PCEA) infusions when monitoring technology suggests the presence of opioid-induced respiratory depression. To facilitate such capabilities, we strongly endorse the efforts to develop international standards for device interoperability and device-device communication.
- It is critical that any monitoring system be linked to a reliable process to summon a competent health care professional to the patient's bedside in a timely manner.”

Problem was revisited at June 2011 workshop!

PCA Safety Issues continue ...

<http://ppahs.wordpress.com/2012/02/01/guest-post-yes-real-time-monitoring-would-have-saved-leah-2/>

This is the story of an 11 year old who died from narcotic-induced respiratory depression. "Ten years after my daughter's death, nothing has changed in the codes of monitoring post-op patients continuously, until they leave the hospital. Alive."

http://www.apsf.org/newsletters/html/2010/spring/12_coalition.htm

This is a statement from a multi-hospital coalition frustrated by ongoing adverse patient events:

"A closed-loop system, which stops or pauses opioid dosing if respiratory depression is detected, is desirable. Systems are most ideally centrally monitored. In any case, alarms should be audible or otherwise available to the primary caregiver, and a mechanism for prompt response should be in place."

<http://ppahs.wordpress.com/about/>

"Carly Ann Pritchard ... suffered an ankle injury and then underwent surgery to reduce lingering pain from her ankle injury. Unfortunately, although she survived surgery, she suffered brain damage because of an accidental overdose from a morphine-filled pain pump - after surgery. A California appeals court recently upheld a jury's award of about \$9.9 million in damages."

Smart PCA monitoring system
American Society of Anesthesiologists
Scientific Exhibit October 2007

*Plug-and-play detection of monitors connected to patient,
Permits selection of “best” monitor and alarm algorithm at point of care*

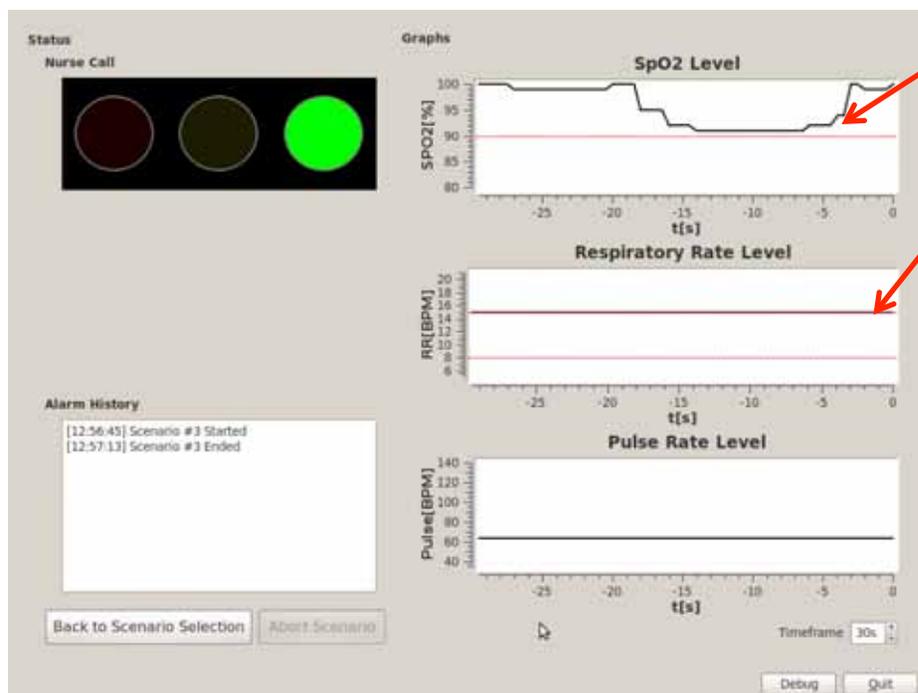

Exhibit recognized with First Place award

PCA Example:

Smart PCA App could increase alarm specificity & sensitivity, stop the pump, and call nurse

Data fusion algorithm masks nuisance SpO₂ alarm

SpO₂ drops transiently, but Respiratory Rate and Pulse Rate are steady, therefore SpO₂ alarm is not activated.

Greater specificity: This potential nuisance alarm has been prevented, because more information is available from other devices.

Greater Sensitivity: Similarly, respiratory depression may be detected earlier by monitoring trend of RR AND SpO₂

Example 2

Cardio-Pulmonary Bypass (heart-lung bypass)

← or →

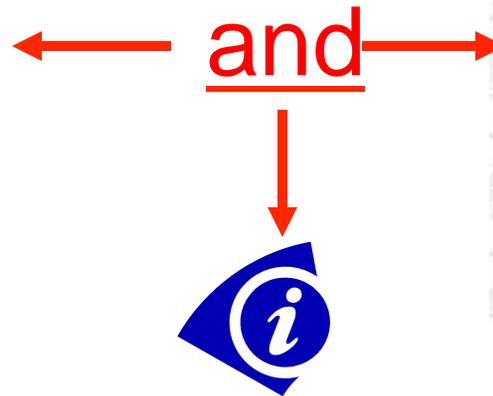

Normal routine: Switch from anesthesia machine ventilator to cardiopulmonary bypass machine, and back to ventilator (after bypass)

Failure to Ventilate after Bypass

- Adverse Anesthetic Outcomes Arising from Gas Delivery Equipment: A Closed Claims Analysis.
- Anesthesiology. 87(4):741-748, October 1997 15 years
- “... In the second case, the anesthesiologist forgot to resume ventilation after separation from cardiopulmonary bypass. The delayed detection of apnea was attributed to the fact that the audible alarms for the pulse oximeter and capnograph had been disabled during bypass and had not been reactivated. Both patients sustained permanent brain damage.”

Almost every surgical team has experienced this error!

Cardio-Pulmonary Bypass

*Smart system would provide warning if ventilator off
and bypass pump flow = 0.*

No App for that

Example n?

- How many more examples? Too Many

Essential Healthcare Needs

- Needs: Improvements in patient safety and healthcare efficiency require innovative system solutions.
- Barriers: Medical systems cannot be fully integrated due to the lack of effective interoperability of medical devices and Health IT systems, especially in high-acuity clinical settings.
- Solutions:
 - Ability to “integrate the clinical environment” is an essential ingredient to create complete EHRs and error-resistant systems

Why have these been intractable problems?

- Solution Involves Multiple Parties: Physicians, Hospitals, Medical Device Manufacturers, FDA, SDOs
 - Not just a business problem
 - Not just a clinical problem
 - Not just a standards problem
 - Not just a software problem
- This is a medical systems problem and a formidable challenge

A Solution Pathway ...

“Smart Phones” are “App Platforms”, designed to enable developers to use processors, sensors, data, and screen UI to deliver Apps.

- Gyro/motion sensors
- Mic and speakers
- Radios (many!)
- GPS
- Operating System designed to effectively deliver App requirements

Over 500,000 apps.
For work, play, and everything in between.

The apps that come with your iPhone are just the beginning. Browse the App Store to find hundreds of thousands more. The more apps you download, the more you realize there's almost no limit to what your iPhone can do.

What could healthcare “apps” do?

That depends on the “app platform”

Epocrates Rx for Apple iOS

This type of app is very useful.
But it is not the subject of today's discussion

Imagine if apps could connect to the sensors/devices in the physical environment, they could finally solve some of these clinical problems

Landing gear not down? -> Smart Cockpit ALARM

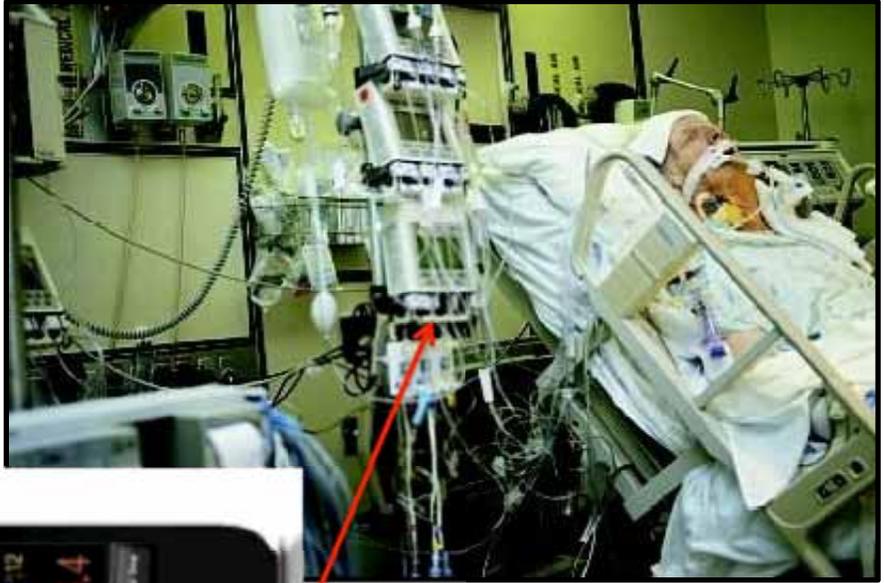

Contextual awareness requires data from several device and systems. e.g. altitude, attitude, flap position, etc.
But, we must respect the complexity of these safety critical systems

ICE - “Integrated Clinical Environment”

Clinical Environments of the Future will be Integrated

- Silos of stand-alone medical devices and IT will be plug-and-play integrated.
- “Apps” will leverage the ICE:
 - Smart alarms, safety interlocks, and closed-loop control will enable “error resistant” systems
 - Comprehensive data acquisition for clinical care, research, and adverse event analysis (Black-box recorder)
 - Biomed equipment management
 - Patient ID and correct clock time will be bound to device data
- Apps for Clinical Decision Support (CDS) will run on standardized ICE platforms, which enables global sharing of apps
- Specialized app development tools will empower clinicians/ researchers to rapidly prototype and then customize apps on the fly

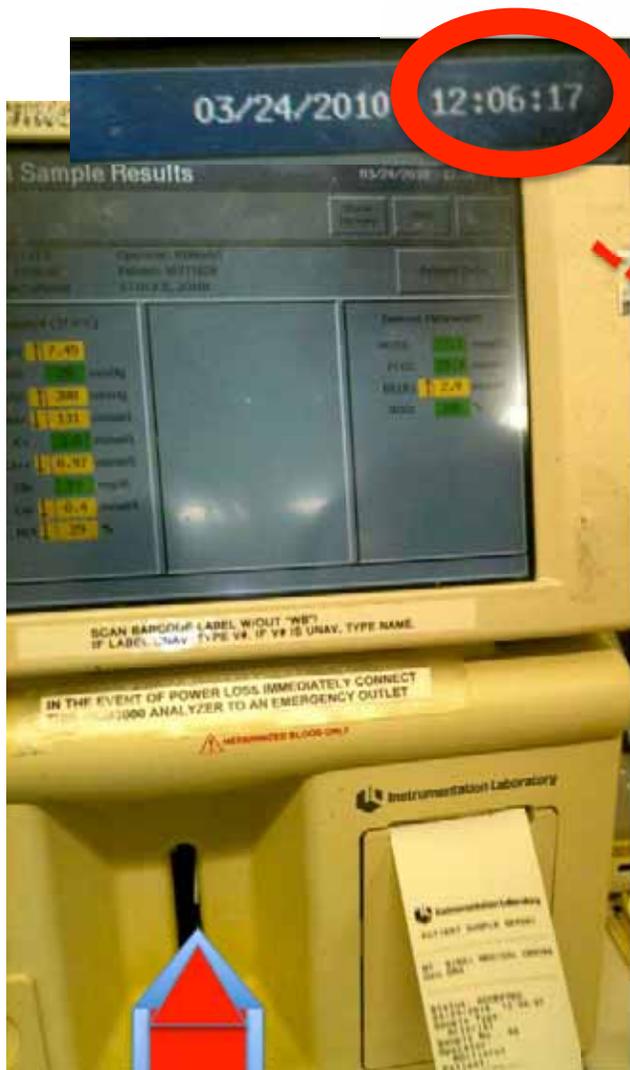

Many Challenges ...

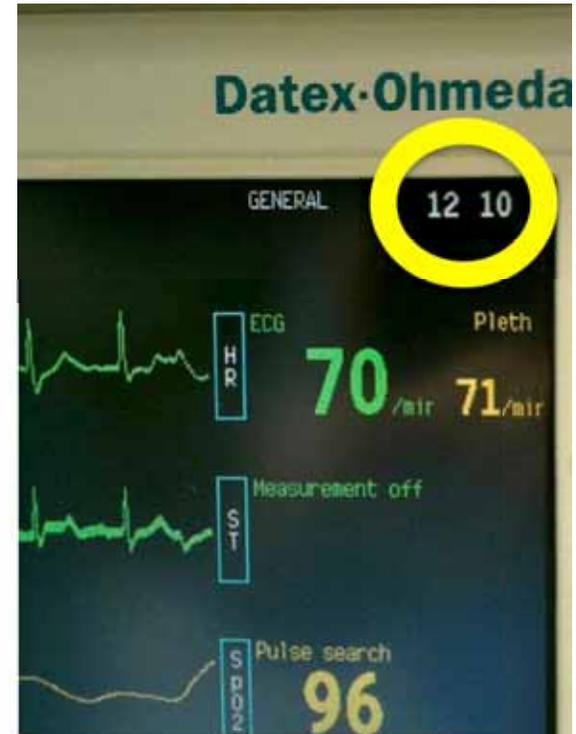

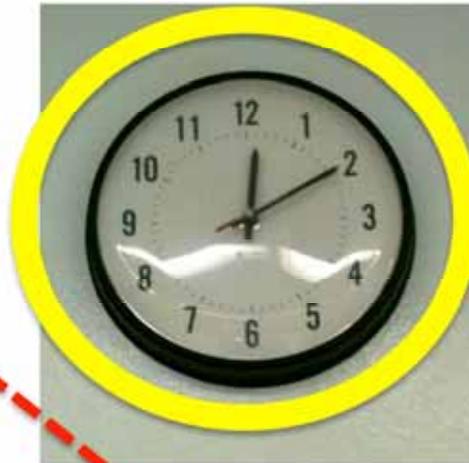

Why is clock time important?

- Undermine integrity of EMR
 - May lead to inappropriate therapy
 - Complicate QA analysis
 - Introduce liability concerns
 - Security implications
- ① Challenge: Who owns this problem? Med device manufacturers? EMR vendors? System integrators? Middleware vendors?
 - ② Challenge: What methods are available to synchronize time in intermittently connected clinical systems?

Blood gas analyzer in OR

EMR time stamp error

Medical devices

A ticking time-bomb

May 23rd 2012, 10:46 by M.H. | SEATTLE

The
Economist

A MAN with one clock knows what time it is, goes the old saw, a man with two is never sure. Imagine the confusion, then, experienced by a doctor with dozens. Julian Goldman is an anaesthetist at Massachusetts General Hospital in Boston. Like many modern health care facilities, it has become increasingly digitised and networked, with hundreds of high-tech medical devices feeding data to a centralised electronic medical record (EMR), which acts as both a permanent repository for health information and a system that can be accessed instantly by doctors to assist with clinical decisions.

Collaborators

Geographically-dispersed stakeholders who want to improve patient safety and healthcare efficiency through innovations enabled by medical device system integration

RESOLVED, That our American Medical Association (AMA) believes that intercommunication and interoperability of electronic medical devices could lead to important advances in patient safety and patient care, and that the standards and protocols to allow such seamless intercommunication should be developed fully with these advances in mind. Our AMA also recognizes that, as in all technological advances, interoperability poses safety and medico-legal challenges as well ... ”

- “Healthcare Delivery Organizations (HDOs) must lead a call to action for interoperability of medical devices and systems.
- One way that HDOs can effect this change is by including medical device interoperability as an essential element in the procurement process and in vendor selection criteria.”

Medical Device Free Interoperability Requirements for the Enterprise (MD FIRE)

Medical Device Interoperability for Patient Safety: Driving Procurement Changes	October 2008
--	--------------

Medical Device Plug-and-Play (MD PnP) Program
Massachusetts General Hospital / Partners HealthCare System
Johns Hopkins Medicine
Kaiser Permanente

This paper discusses the requirements for medical device interoperability in the modern healthcare environment. These requirements are changing the way in which we procure medical devices. An appendix provides shareable RFP and contract language examples.

Background

Medical devices, essential for the practice of modern medicine, have been traditionally designed to operate independently using proprietary protocols and interfaces for system integration. With the increasing complexity of the healthcare environment, stand-alone, proprietary devices and systems no longer provide an acceptable solution. Medical devices and systems must easily integrate with other vendors' equipment, software and systems in order to improve patient safety.

Essential improvements in patient safety and healthcare efficiency in high-acuity clinical settings require system solutions that can be implemented using standardized, interoperable medical devices and systems.^[1] Clinical societies and the FDA now endorse the potential of medical device interoperability to lead to "improvements in patient safety and clinical efficiency".^{[2][3]}

Our collaboration through the Medical Device Plug-and-Play (MD PnP) program over the last four years leads us to conclude that Healthcare Delivery Organizations (HDOs) must lead a nationwide call to action for interoperability of medical devices and systems. One way that HDOs can effect this change is by including medical device interoperability as an essential element in the procurement process and in vendor selection criteria.

We HDOs wish to adopt interoperability standards for medical device interconnectivity. We also recognize that the necessary standards are not yet fully developed or widely implemented by medical equipment vendors. However, we believe that adoption of standards-compliant interoperable devices and systems will enable the development of innovative approaches to improve patient safety, healthcare quality, and provider efficiency for patient care; will improve the quality of medical devices; will increase the rate of adoption of new clinical technology and corresponding improvements in patient care; will release HDO resources now used to maintain customized interfaces; and will enable the acquisition and analysis of more complete and more accurate patient and device data, which will support individual, institutional, and national goals for improved healthcare quality and outcomes. Our goal is to document the clinical demand and to strongly encourage the development and adoption of medical device interoperability standards and related technologies.

Mapping from ASTM ICE Standard

Mapping from ASTM ICE Standard (Contd.)

Data Logger (ASTM F2761)

- The purpose of the data logger is to record low-level device data in an open, standardized, and time-synchronized manner.
- The log includes:
 - Commands
 - Button presses
 - Location
 - Physiologic and technical alarms
 - Physiologic data from patients
 - Information about the status of devices
 - Device connections and disconnections from ICE manager
- Data Log supports Analysis and Playback for two complementary purposes:
 - Analysis of device interactions (debugging)
 - Analysis of adverse events involving patients (clinical)

MD PnP NIH Quantum Grant

Development of a Prototype Healthcare Intranet for Improved Health Outcomes

- The creation of an eco-system for interoperability of medical device and clinical information systems to support innovation in patient safety and healthcare quality

SHARP Research Area Five/NIH Affiliate:

Medical Device Strategic HIT Advanced Research Project

Overview:

The MD SHARP project is led by the Medical Device Plug-and-Play (MD PnP) Interoperability Program based at CIMIT (Center for Integration of Medicine & Innovative Technology) and Massachusetts General Hospital (part of the Partners HealthCare System). MD PnP is an interdisciplinary, multi-institutional medical device informatics research program that seeks to improve patient safety and clinical efficiency by enabling standards-based integration of medical devices, and is developing a framework and capabilities for integrated clinical environments of the future. We have been working to accelerate the adoption of medical device interoperability by providing interoperability building blocks (use cases, standards, a neutral lab sandbox, and open research tools) and by changing clinical and market expectations of what can be achieved.

MD SHARP is a Quantum Project funded by the National Institute of Biomedical Imaging & Bioengineering at the NIH and adopted as an affiliate project of the SHARP program. The goal of the MD SHARP project is to develop a prototype healthcare intranet for improved health outcomes, which includes an open platform and tools to enable clinical application development. Our platform is being designed to be compliant with the ICE standard (Integrated Clinical Environment, ASTM F2761) and will build on four core Clinical Scenarios, selected to represent common acute care devices and key device interoperability functionality.

The Main Themes Are:

- Safe integration of medical devices into patient-centric networked systems
- Synergy with current work on developing regulatory pathways for interoperable medical devices
- Development of testable clinical requirements for key aspects of medical device interoperability, including architecture and safety
- Development of safe hospital protocols for interoperable medical devices, including clinical decision support protocols with technical and process requirements
- Creation of validated, safe, reliable, secure, and re-usable software interfaces that are easily re-used by the medical device industry, Health IT vendors, academia, and government
- Updates and improvements to existing medical device interface standards
- Technical solutions to improve accuracy of medical device data time-stamps
- Creation of a simulated clinical environment and related tools where workflows, protocols, interactions, and technology can be tested and validated

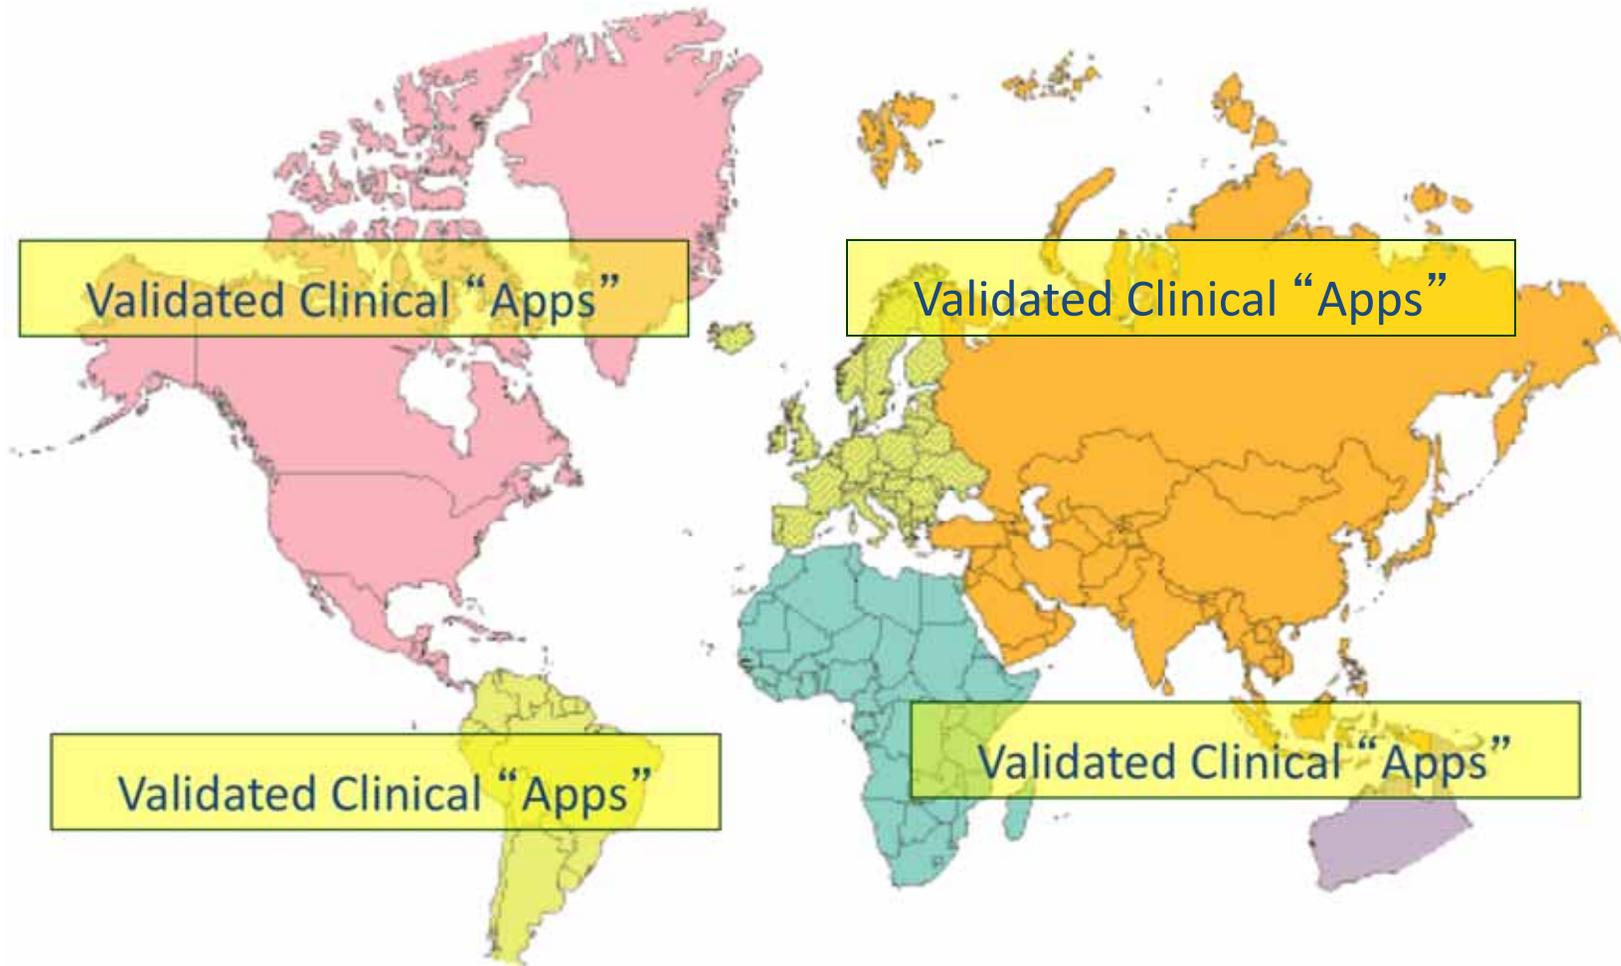

Quantum Scenarios

1. **PCA Safety Interlock**, example of component-level medical device interoperability
2. **ICU preparedness**, example of in-hospital patient transfer and rich clinical context
3. **Tele-health (TH)** devices in hospital, example of transferring care from home to hospital and use of TH devices for high-acuity care
4. **FDA regulatory** – staged implementation of framework for levels of interoperability and associated levels of hazards and their mitigation

What could we accomplish in healthcare with open, interoperable medical device app platforms?

- Innovation
 - Rich contextual data (for clinical decision support)
 - Means for rapid prototyping of new sensors and algorithms
 - Facilitate validation for regulatory clearance
 - Swap devices as needed to optimize selection
- And what we have seen in other domains
 - Crowd-sourcing of “Apps”: If device platform is standardized, apps can be developed by global expert community

When standardized clinical databases are populated with standardized data, validated clinical rules or “Apps” will be shared globally

Crowdsourcing of clinical apps could transform healthcare
