

Integrating Physiological Monitoring in the Industry

André Lourenço

Jan 2022

Origins

Applied Research at Instituto Superior Técnico, University of Lisbon

**PATTERN RECOGNITION,
ARTIFICIAL INTELLIGENCE AND
MACHINE LEARNING GROUP**

Area of acquisition and automatic processing of biosignals.

HW, SW & algorithms with the goal of achieving automatic non-collaborative recognition of humans.

Main topic research: biometrics and ECG

- The electrocardiogram (ECG) is an emerging biometric trait.
- Pioneer works from 2001 showed that the ECG contains sufficient discriminatory information to identify individuals.
- As measured from the body surface, the ECG signal is directly related to each individual's physiology, skin conductivity, genetic singularities, heart position and shape.

Your Heart is Unique

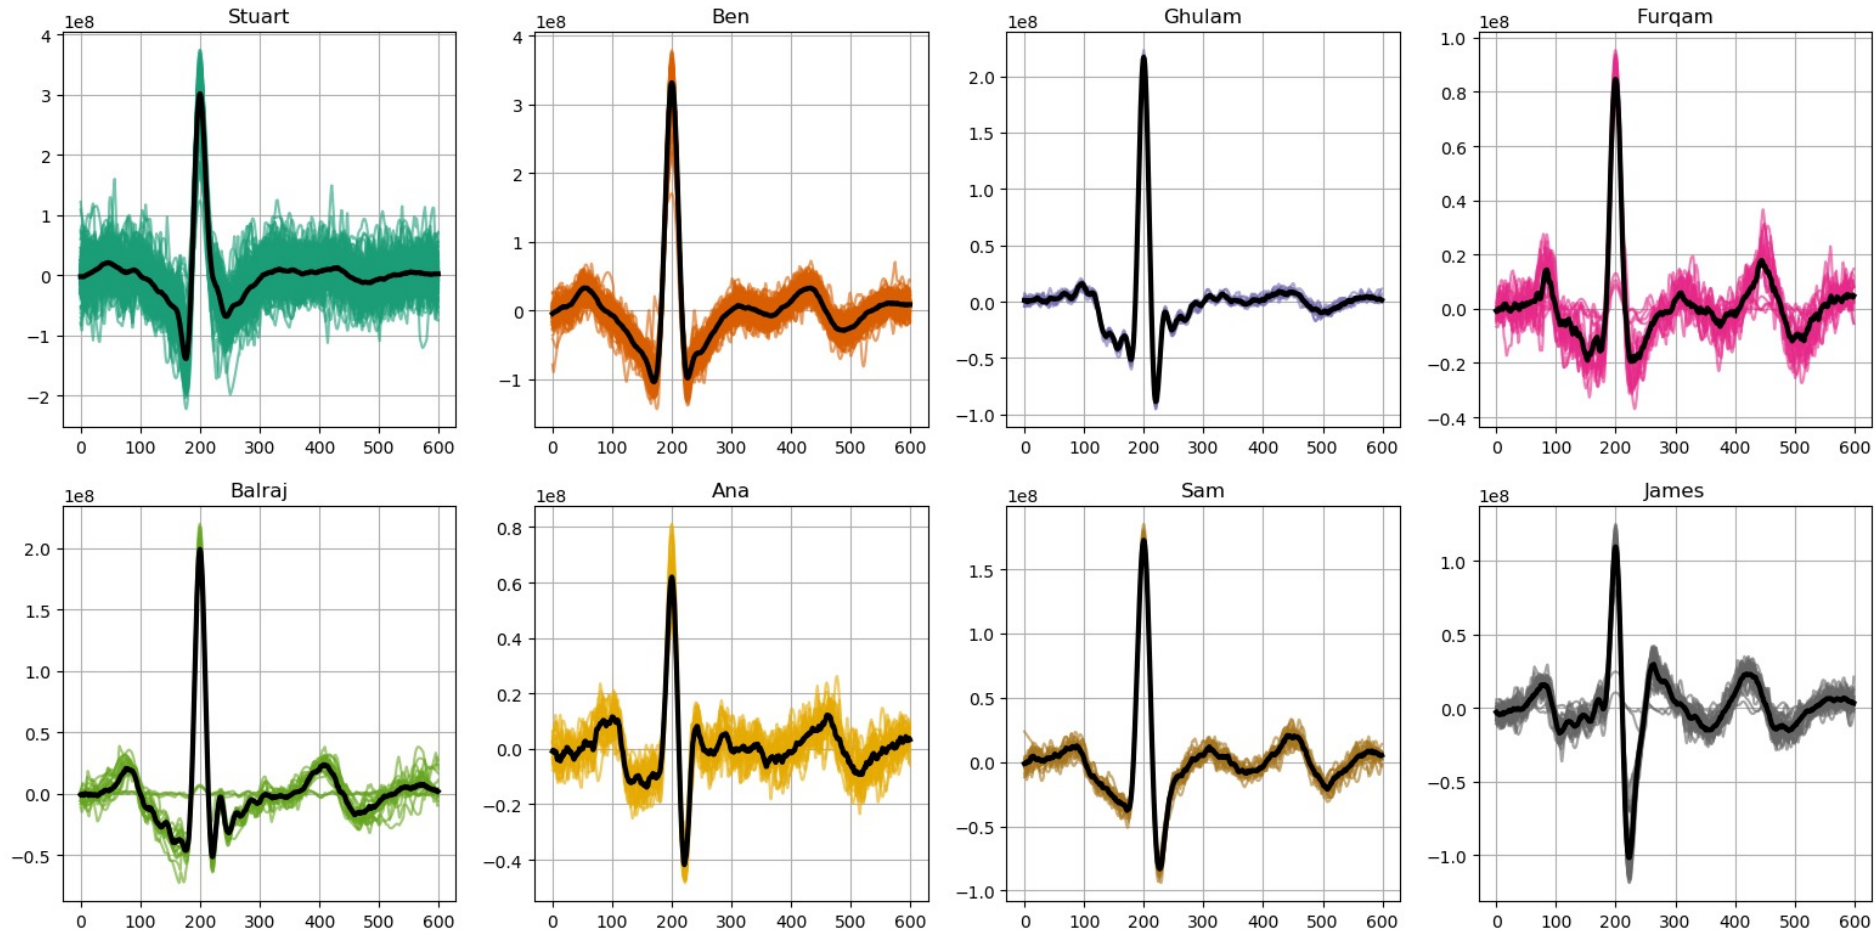

The ECG is the record of the electrical activity of the heart. The shape is different from individual to individual. (see overlapping line)

Heart Rate Variability, is the physiological phenomenon of the variation in the time interval between consecutive heartbeats.

Practical Examples

Sample of **9 individuals**, acquired on **Jan-2020** in **Dunton, England**, in a real-time acquisition demonstration (steering wheel), to researchers of **Vehicle Manufacturing Company**.

A World of Opportunities

Cardioid Embedded Systems

- Features
- Single-lead ECG analog front-end
- MCU with several communication interfaces (BLE, UART, I2C, SPI)
- Power supply: 12-24 V; 5V USB plug; 3.7 V single cell Li-Po battery
- Low-power consumption
- ECG-based biometrics
- Wellness: several cardiac arrhythmias; fatigue; sleepiness; drowsiness
- FMS for fatigue-related driver performance

Inovação nacional em IoT mostra-se em Lisboa

Das máquinas de vending aos volantes inteligentes, não faltam exemplos portugueses de IoT

Os volantes inteligentes fazem parte do projeto CardioWheel, desenvolvido com a Barraqueiro, mas há inúmeras aplicações possíveis, explica o CEO André Lourenço. "É sempre a mesma tecnologia nuclear, aplicada a diferentes funções." A CardioID pretende também extrair dos dados informações sobre o estado emocional do utilizador, saúde e níveis de stress - por exemplo, para monitorizar o bem-estar de trabalhadores isolados, em áreas remotas. "Desde que a pessoa interaja com um objeto com as duas mãos, nós conseguimos reconhecê-la e a partir daí podemos comunicar numa perspetiva de internet das coisas com outros dispositivos e melhorar a experiência de utilização pelo simples facto de reconhecermos o indivíduo."

CARDIOID TECHNOLOGIES

CISM - CardioID Smart Monitoring

CardioID is developing a technology for non-intrusive acquisition of the heart signals that enables pervasive health monitoring, emotional state assessment, drowsiness detection, and identity recognition. CardioID Smart Monitoring (CISM) is a solution for lone worker monitoring based on AIQ Smart Shirt. It acquires the electrocardiogram (ECG), together with inertial information of the user and determines user state providing man-down, vital signs, and fatigue indicators to the backend. This information is transmitted via BLE redundantly to two devices - a smartphone and a LoRa M2M transceiver - received by our web-API, processed by custom algorithms, and delivers a set of indicators to a dashboard, or integrated with a alarm-management platform.

Driver Behavior

Labels (Level of drowsiness)

Karolinska Sleepiness Scale	
1	Extremely alert
2	Very alert
3	Alert
4	Fairly alert
5	Neither alert nor sleepy
6	Some signs of sleepiness
7	Sleepy, but no effort to keep alert
8	Sleepy, some effort to keep alert
9	Very sleepy, great effort to keep alert, fighting sleep

This rating is given by the driver, using his perception of his level of drowsiness

 - Heart-rate variability (HRV)
 - Drowsiness indication based on Karolinska Sleepiness Scale (KSS)
- Communication Interfaces
 - BLE

Test Vehicles

Valu3s use-case

Automotive

HealthCare

Challenges to be solved

- Verify security and integrity of transmission model
- Test accuracy, reliability, and robustness of classification models under uncertainty and in un-cooperative environments; integration in simulator-based testing
- Formal specification and verification of functional and non-functional of embedded real-time properties related to safety and security
- Create a complete specification of the software to be deployed (a smaller version of CardioID's implementation using the MARS domain specification language being developed within the scope of VALU3S)
- Identify safety properties related to timing that can be observed and verified upon runtime of the system
- Formal cryptographic analysis to ensure proven-correct protocols being used

Potential V&V Methods

- HW-in-the-loop test to simulate the system behaviour when injecting test scenarios
- Faults in data transmission and their effects on performance. The experiments are to be done in driving simulator.
- **Other V&V methods and tools in analysis by VALU3S partners for this use case**
